

For my metal project, I made a sponge holder out of spoons and forks.

Problem: The sink counters get dirty and disorganized with sponges thrown onto the side. I wanted a way to organize/store the sponges for use.

Solution: I created a sponge stand by bending and welding spoons and forks together resembling a cutlery person. The spoons and forks added to the dishwasher vibe which I really enjoyed. I ended up sewing a mini apron for the final look.

Process: I started this project with inspiration from a cutlery phone stand of a person, however I realized making a sponge holder would be much more practical for my daily use. I found two stainless steel spoons and four forks in my kitchen instead of buying new ones because I wanted to reduce the risk of snapping the utensils by using ones I have used and broken into.

I used the metal bending machine to bend the spoon and fork limbs into a human-like figurine with legs and arms bent and flattened hands as the stand for the sponge.

I took the welding training and welded the stainless steel with a steel welding material because the maker space did not have stainless steel welding material. I increased the voltage to 65 and it ended up working well!

Being able to find a way to support the structure so that I could weld was surprisingly difficult, but it ended up working. I found that tacking was the most effective instead of running a line down the structure.

After I welded my project, I found out that Yeji was also making the same thing! so we dressed up our figures as a married couple:
