

**People use skateboards to they can walk
from home to class quickly**

**but after class, people like to walk back
home with their friends**

🦠 unhygienic
😓 tiring to carry

and they carry their skateboards with their hands

Skate BOO.

a leash for your skateboard
+ a pet companion !

brainstorm & prototyping

- Experimented with various leash materials.
- Brainstormed the ideal way to attach the skateboard to the leash.

- Integrated crochet elements into Skatebud.
- Enhancing personalization and customization.

brainstorm & prototyping

Soft Leash

crafted from crocheted materials to offer a comfortable and tactile grip for users. Its softness adds to the overall user experience and enhances comfort during transport

Point rigid base

providing stability and secure placement on the skateboard deck, ensuring it remains firmly attached during use

Convenient Velcro

attachment includes a Velcro strap mechanism that allows for quick and convenient adjustments, ensuring a snug fit on the skateboard deck

final product

The final product, aimed at skateboarders walking with friends on campus, embodies Chindogu's by tackling the inconvenience of carrying a skateboard, transforming a mundane task into a delightful and unique experience.

not really

*Chindogu inventions should not be practical or functional in a conventional sense.
They are intentionally designed to be bizarre or absurd.*

seeing someone walk your skateboard like a pet is a
bizarre sight and not particularly conventional

exist-essential

A skateboard doesn't need to be walked, but it solves the issue enough to reduce weight and increase sanitation for the user. The product still holds a purpose that will solve the consumer's problem, but it does not eliminate the issue entirely because you still have to roll the skateboard around which is what makes its existence not necessary.

anarchic

Chindogu often challenges societal norms and expectations. They can be anarchic in their design and concept.

Taking a skateboard for a "walk" looks ridiculous and most people would not adopt this, but people would still envy the lighter load walking the skateboard provides compared to the traditional method of holding it in their hand.

universal un-uselessness

Chindogu should be universally unuseful, meaning they are not meant to be useful to anyone anywhere.

A skateboard leash may seem practical at first, but when thinking about the dynamic movement and speed of skateboarding, there's a chance that such an attachment could become a hindrance or even dangerous.

NOT FOR SALE!

Chindogu items are typically not meant to be commercial products. They are more like conceptual art pieces.

Producing this was a DIY project. It would be difficult and not cost-effective to reproduce the same way. Crocheting cannot be mass manufactured.

Stop trying to be funny...

The leash concept, while whimsical, should be a sincere invention and not just a joke product. It's made with genuine intent to alleviate the struggle people who transport to class with a skateboard have throughout the day.

Propaganda...not

Chindogu should not be used for propaganda or any ulterior motives. They should be a form of creative expression.

There are no messages of propaganda The design has a playful kid-toy feel to it that sends a neutral message.

Keep it clean

The device is composed of three simple parts: a 3D printed block to strap onto the skateboard with a pet sitting on top, velcro to adjust it onto the board, and a leash.

don't get greedy!

*Chindogu creators should not become overly ambitious with their inventions.
Simplicity and absurdity are key.*

This is a simple design and a one step process that solves the issue very quick and simple without exploiting any parties.

Chindogu for all!

The concept of the skateboard leash can be used by anyone and is bizarre, amusing, and does not hold a practical purpose.

BRAINSTORM / PROTOTYPE

Skatebud is an attachment designed to make carrying your skateboard while walking with your friends not only more convenient but also entertaining.

Narrowed our ideas down to this concept because while it addresses a clear problem (the struggle of physically carrying your skateboards), it also has unintended drawbacks that add to their humor.

Problem Validation: Our observation of students on campus struggling to carry their skateboards, especially when they are walking with other people.

We tested different materials for the leash and brainstorm the ideal attachment for the skateboard.

We decided to crochet elements to the Skatebud attachment to make it more personal and customizable.

Crochet offers a wide range of possibilities for adding unique designs, colors, and textures to the attachment

Following the ideation and prototyping phases, we proceeded by measuring the skateboard's dimensions and utilized these measurements to prototype a sturdy attachment that would securely fit onto the skateboard deck.

FABRICATION

3D modelled a point rigid base, providing stability and secure placement on the skateboard deck, ensuring it remains firmly attached during use.

Crocheted a leash, crafted from soft yarn, offers a comfortable and tactile grip for users. Its softness adds to the overall user experience and enhances comfort during transport.

FINAL PRODUCT

The final product designed to address the issue of skateboarders carrying their boards while walking with friends on a college campus, embraces the whimsical spirit of Chindogu.

This concept playfully exaggerates the solution to an everyday problem. Furthermore, the idea of turning the skateboard into a companion introduces an element of absurdity, as most college students don't have pets but wish to have one.

By creatively tackling the minor inconvenience of carrying one's skateboard, this Chindogu-inspired design transforms an ordinary task into an entertaining and unconventional experience.
